

CONGRATULATIONS!

Internationally, a land management system collective failure usually occurs when people (especially those who hold important positions) and organized groups (political parties, private sector and unions) serve methodically only their narrow selfish interests.

The congress in Romania on the topic: "From Volume to Quality: Bridging the Gap for Spatial Data Infrastructure", joint to EGoS GA and Geomat 2016, on: "Spatial Information Management for Sustainable Development", was a very positive initiative.

Surveyors in Romania gave an important global lesson with their modern perception on the importance of "cooperation" among surveyors in the public and private sector, universities, central government and local government, the International Federation of Surveyors, the European Surveyors, all other relevant professions (layers, notaries, economists, engineers, etc.) and the society.

Congratulations to the organizers! FIG Com 3, the Technical University of Iasi and the Romanian Surveyors Association, and especially to our delegate Ionut Savoiu, Deputat - Parlamentul Romaniei and our FIG Com 3 chair Enrico Rispoli!
